Professional Experience

Full Stack Web Developer | NetOne Soluciones Web – ERP Netegia
La Matanza, Buenos Aires | 03.2025 – Present

- Developed ERP functionalities, migrating legacy modules from **pure Java** to a modern architecture using **Spring Boot, Angular, and MySQL**.
- Worked across both **frontend and backend**, applying **Clean Code principles** and maintaining high-quality documentation.
- **Optimized** SQL queries and core algorithms, achieving significant improvements in performance and scalability.
- Built **public API REST** with JWT, documented using OpenAPI/Swagger.
- Cut a bulk document-processing job from **~10 minutes to under 1 minute**, by reworking its database access and then processing the documents in parallel batches with **Java 21 virtual threads**.
- Consumed external marketplace and payment APIs (MercadoLibre, Mercado Pago, Tiendanube).
- Managed tasks **independently**, leading the full development cycle from analysis to deliver.
- Test with Junit5 and Mockito.

Skills

Java 21, Spring Boot, JPA/Hibernate, Angular 18, Algorithms, Data Structures, OOP, Git, MySQL, MSSQL, Junit 5, Mockito, Linux, UML, English (Advanced), Spanish (Native).

Education

National university of La Matanza | *Bachelor of computer science (60% done)* | *La Matanza, Buenos Aires* | **03.2021 - Present**

Ministry of Economy of Argentina | *Full Stack programming course*

Online | **Completed 6.2022**

- Covered foundational OOP programming concepts, and advanced technologies, Java, Spring Boot and Angular.

Projects

BudgetKing | Financial Tracker web application designed for personal use and learning purposes, built with Java, Spring, Angular, and a containerized MySQL database. Tracks income and expenses, groups them by category and spending accounts, and filters data by date with summary dashboards. Implemented basic CI/CD and layered unit & integration tests. [Repository](#).

MySongSet | This project is a web application for managing song sets, like the ones that artist use on their concerts, because when I want to play the guitar, I forget all the songs I can play and always end up playing the same 10 songs. It is implemented with a backend in Spring (with Java 21), a frontend in Angular, and uses PostgreSQL as the database. See [GitHub](#) ReadMe for more information.

Products API | RESTful API that manages multiple endpoints to simulate a products store, I used Java 21 and Spring Boot, with spring security, role and JWT authorization, see [GitHub](#) ReadMe for more information.
